

Fundamentos de Java

Parte 9

Presenta

Alan Badillo Salas

Marzo 2023

```
public static void main(String[] args) {
```

```
JFrame myFrame = new JFrame();
```

```
}
```

```

5      public static void main(String[] args) {
6
7          JFrame myFrame = new JFrame();
8
9
10
11     }

```

- 💡 Add import for javax.swing.JFrame
- 💡 Create class "JFrame" in package learn (Source Packages)
- 💡 Create class "JFrame" in learn.LearnSwing_001
- 💡 Remove unused "myFrame" >
- 💡 Split into declaration and assignment >

```
import javax.swing.JFrame;
```

```
public class LearnSwing_001 {
```

```
    public static void main(String[] args) {
```

```
        JFrame myFrame = new JFrame();
```

```
    }
```

```
}
```

```
public static void main(String[] args) {
```

```
    JFrame myFrame = new JFrame();
```

```
    myFrame.setSize
```

```
}
```

setSize(Dimension d) void
setSize(int width, int height) void

[java.awt.Window](#)

```
public void setSize(int width, int height)
```

Resizes this component so that it has width `width` and height `height`.

This method changes layout-related

```
public static void main(String[] args) {
```

```
    JFrame myFrame = new JFrame();
```

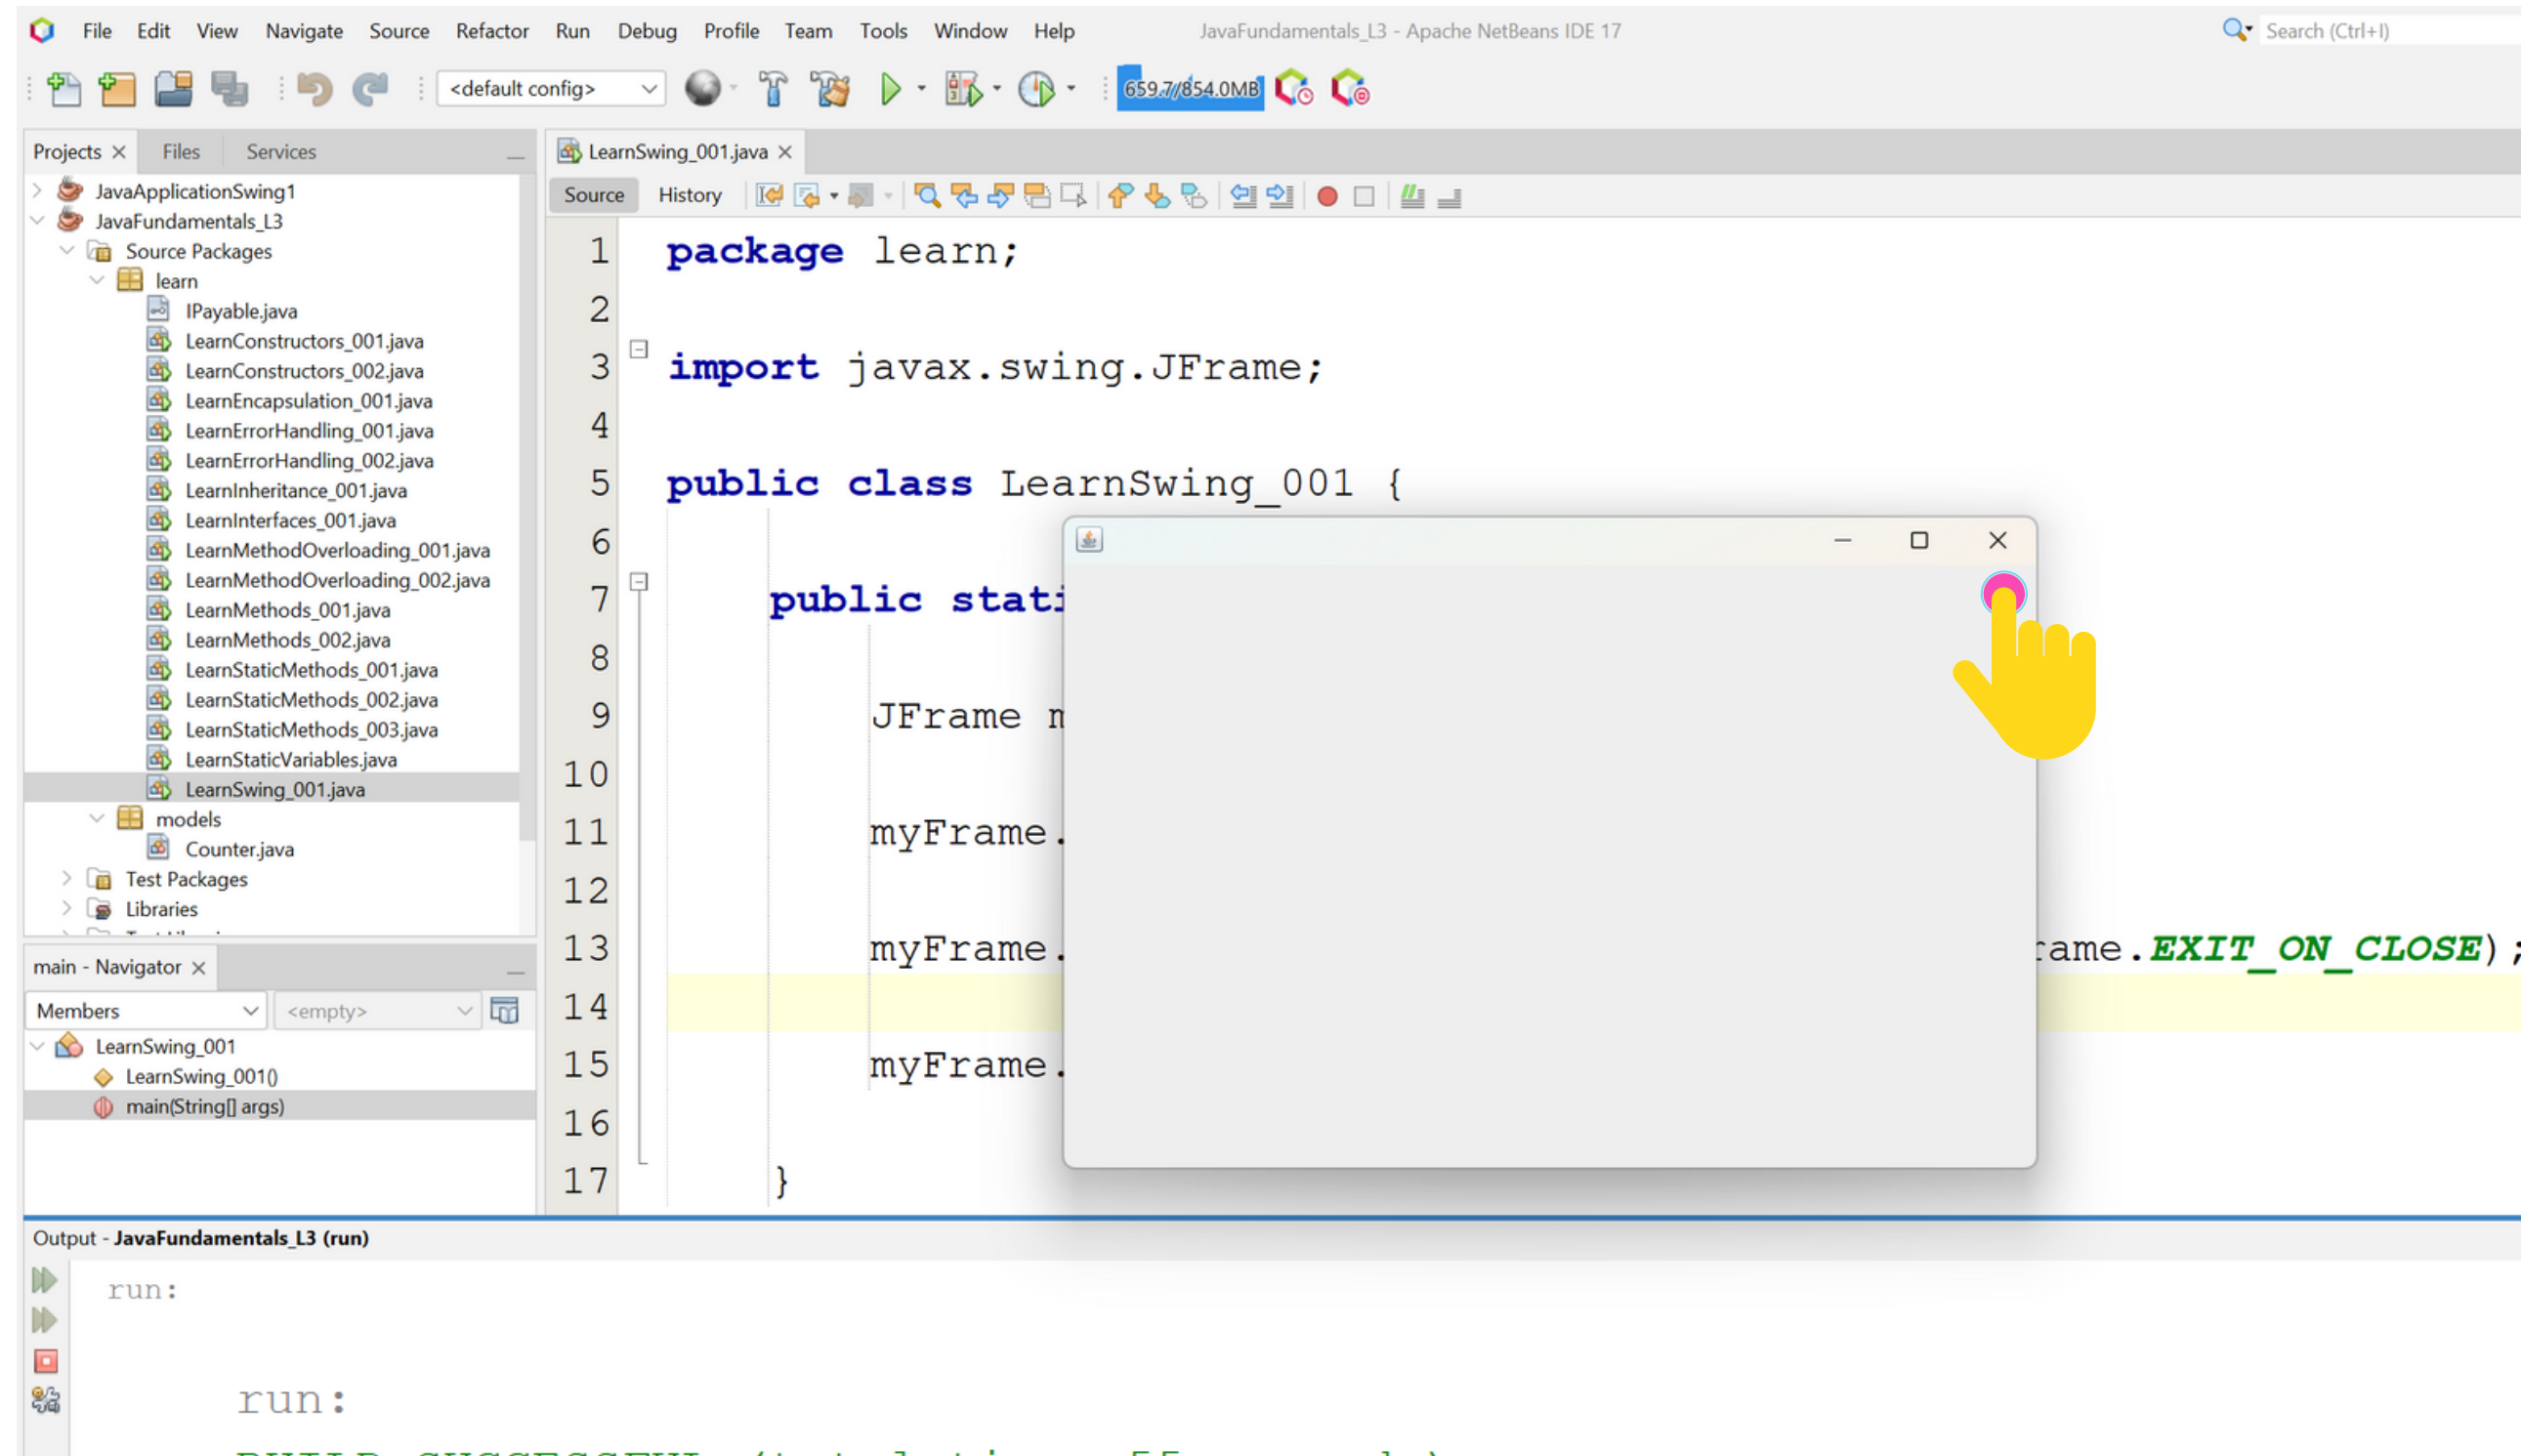

```
    myFrame.setSize(width: 600, height: 400);
```

```
}
```

```
public static void main(String[] args) {  
    JFrame myFrame = new JFrame();  
    myFrame.setSize(width: 600, height: 400);  
    myFrame.setDefaultCloseOperation(operation: JFrame.EXIT_ON_CLOSE);  
    myFrame.setVisible(b: true);  
}
```
